

This hairy wart is one of the most costly health problems in modern dairy cows. The wart grows rapidly and causes severe pain. She becomes so sore that she will stop eating and drinking. Milk production drops. Also, in this condition the illness is highly infectious and spreads throughout the herd.

Costs as little as 16 cents per wart

The same wart four days later has stopped oozing, formed a tough water proof scab, and the animal is out of pain. She is no longer lame and her appetite has returned. The wart is gone.

HealMax Foam

When should you use HealMax Spray?

HealMax Spray is a special formulation of our HealMax footbath concentrate and is available in several forms:

HealMax WART Spray is sprayed directly on individual warts and is applied once or twice either on the same or consecutive days. Wart spray is formulated to cling to the problem area. Sold in quart spray bottles or one gallon containers.

HealMax HERD Spray is used as a treatment and preventative for the whole herd. For outbreaks it should be applied either twice per day for two days or once per day for four days.

HealMax FOAM (NEW!) is an economical treatment and preventative for the entire herd. Foam provides visible coverage and extra contact time.

For milking cows apply either formulation in the parlor immediately prior to milking. This gives HealMax plenty of time to act before releasing the animals back into a dirty environment.

For dry cows or heifers apply during feeding with the animals in headlocks.

Suggested Retail Price

HealMax Wart Spray

Quarts - \$39.95 * includes spray bottle.
Gallon - \$134.95

WART Spray treats 200+ warts per quart.
